

A small investment

# A HUGE IMPACT

Does this look familiar?

It can happen so easily...

**Why is a 90-minute fire-resistant safety cabinet seen as a minor add-on, when it protects the largest share of your operational investment?**

## A small incident can stop an entire operation.

In industrial environments, a fire rarely affects just one area. Improper storage of flammable or reactive hazardous materials can turn a localised incident small local fire into a facility-wide shutdown.

The consequences go far beyond physical damage:

- ▶ Equipment replacement delays
- ▶ Missed customer commitments
- ▶ Production losses

Restarting operations often takes longer than expected, especially when specialised machinery or electrical systems are involved.

## Buying time. Protecting operations.

Fire-resistant safety cabinets are designed to protect flammable substances, hazardous chemicals and lithium-ion batteries during a fire event. The objective is clear: to buy critical time.

They are designed to help:

- ▶ Protect continuity – avoiding extended shutdown, missed deliveries and costly rebuilds.
- ▶ Protect people – reducing the risk of fire escalation from stored hazardous substances
- ▶ Protect assets – limiting fire spread to machinery, stock and infrastructure
